

Investigation of Pt-Pd Nanoalloys using a Genetic Algorithm

L.D. Lloyd, R.L. Johnston and S. Salhi
University of Birmingham

A study has been made of Pt-Pd bimetallic ("nanoalloy") clusters, using the many-body Gupta potential. This work involves the development of a genetic algorithm which would allow determination of larger nuclearities. Evolutionary progress is investigated and the lowest energy structures as a function of size and composition analysed.
